Abstracts

Non-selective oil skimmers are mechanical devices designed to remove floating oils, greases, and other hydrocarbons from the surface of water or industrial fluids without distinguishing between different types of contaminants, making them suitable for applications where a broad range of immiscible liquids must be continuously or periodically removed to maintain water quality, comply with environmental regulations, or recover valuable materials. These systems typically employ methods such as belts, drums, or tubes that pass through the fluid surface to adhere and lift oils, which are then scraped or squeezed off into a collection container, and they are widely used across industries like wastewater treatment, manufacturing, food processing, marine operations, and mining, where they help reduce pollution, protect equipment, and support recycling efforts by efficiently extracting free-floating oils without the need for chemical additives or complex filtration mechanisms.

The global Non Selective Oil Skimmer market size was estimated at USD 142.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.75% during the forecast period.
