Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Non-solvent Lamination Adhesive competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. A non-solvent lamination adhesive is a type of adhesive used in the lamination process that does not rely on solvents for its application and performance. Unlike traditional adhesives that contain solvents which need to be evaporated or removed during the lamination process, non-solvent lamination adhesives are typically in a liquid or semi-liquid state without the presence of significant amounts of volatile solvents. These adhesives are formulated to have excellent bonding properties, allowing them to effectively adhere different substrates together, such as films, papers, and foils, in the production of laminated products. They often consist of reactive components that cure or cross-link upon application or through the addition of a catalyst, forming a strong and durable bond. Non-solvent lamination adhesives offer several advantages, including reduced environmental impact due to the lack of solvent emissions, improved safety as they are less flammable, and enhanced product quality as they can provide a more consistent and even bond. They are commonly used in industries such as packaging, printing, and flexible electronics, where the production of high-quality laminated materials is essential.

The global Non-solvent Lamination Adhesive market size was estimated at USD 1927.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.80% during the forecast period.
