Abstracts

Non-surgical fat reduction refers to a category of medical aesthetic treatments designed to reduce localized fat deposits without the need for surgery, incisions, or significant downtime, utilizing technologies such as cryolipolysis (which freezes and eliminates fat cells), laser or radiofrequency energy (which heats and disrupts fat cells), ultrasound (which targets and destroys fat cells with sound waves), or injectable deoxycholic acid (which dissolves fat cell membranes). These procedures are distinct from surgical interventions like liposuction, as they are minimally invasive or non-invasive, typically require multiple sessions for optimal results, and are intended for individuals close to their ideal body weight seeking contouring rather than significant weight loss.

The global Non Surgical Fat Reduction market size was estimated at USD 1483.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 13.20% during the forecast period.
