## Abstracts

Nonionic cellulose ethers are a class of water-soluble polymers derived from cellulose, primarily through etherification with reagents such as ethylene oxide or propylene oxide, resulting in products like methyl cellulose (MC), hydroxypropyl methyl cellulose (HPMC), and hydroxyethyl cellulose (HEC), which are characterized by their non-ionic nature, thermal gelation, surface activity, and ability to modify viscosity, water retention, and stability in various formulations. These versatile additives are widely utilized across industries including construction (in cement-based mortars, tile adhesives, and gypsum plasters for improved workability and water retention), pharmaceuticals (as binders, film formers, and controlled-release agents in tablets and capsules), food (as thickeners, stabilizers, and emulsifiers), personal care (in shampoos, lotions, and creams for rheology control), and paints and coatings (as protective colloids and thickeners), owing to their biocompatibility, non-toxicity, and tunable physicochemical properties.

The global Nonionic Cellulose Ether market size was estimated at USD 1815.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.45% during the forecast period.
