Abstracts

Nourseothricin sulfate is a broad-spectrum antibiotic produced by the metabolism of *Streptomyces nourseothricin*. Its main components are a mixture of ST-F and ST-D, which has the activity of inhibiting the growth of prokaryotes and eukaryotes. Its characteristic is that it inhibits protein synthesis by inducing mRNA miscoding. As a selective antibiotic in genetic recombination engineering research, it has high screening and specificity. The advantage of nourseothricin sulfate is that it not only has an inhibitory effect on a variety of microorganisms, but also can achieve the encoding of nourseothricin N-acetyltransferase by combining with the resistance gene *nat1*, thereby reducing the activity of antibiotics, providing a tool for microbial control and genetic engineering research.

The global Nourseothricin Sulfate market size was estimated at USD 332.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.80% during the forecast period.
