Abstracts

Ntc inrush current limiters, or negative temperature coefficient thermistors, are specialized electronic components designed to protect electrical circuits from excessive current surges during power-up by offering high initial resistance that rapidly decreases as they heat up due to self-generated Joule heating, thereby allowing normal operating current to flow once the device has reached a stable thermal state; these components are critical in applications involving capacitive loads, such as power supplies, motor drives, and converters, where uncontrolled inrush currents could otherwise damage sensitive components, cause nuisance tripping of circuit breakers, or reduce the lifespan of the equipment.

The global Ntc Inrush Current Limiters market size was estimated at USD 580.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
