Abstracts

Nuclear asset management refers to the comprehensive, systematic, and value-driven management of all key assets in the nuclear energy and related sectors, encompassing the entire lifecycle. This management encompasses not only tangible assets such as nuclear power plants, research reactors, and nuclear fuel cycle facilities, but also intangible assets such as operating licenses, intellectual property, human capital, and financial reserves. This management system, anchored in the core principles of safety, reliability, economic optimization, and compliance, covers all asset lifecycles, from planning and design, procurement and construction, long-term operation, life extension and modification, to safe decommissioning and waste disposal. The core objective of NAM is to achieve a balance between safety and cost-effectiveness through a systematic approach, ensuring the high reliability of nuclear facilities throughout their lifecycles while strictly controlling costs and optimizing asset value. This approach requires the establishment of systematic technical specifications, rigorous financial planning, and dynamic risk management mechanisms, incorporating in-depth feedback for continuous improvement. Particular emphasis is placed on addressing long-term risks, including equipment aging management, technology upgrade strategies, and radioactive waste disposal plans spanning 10,000 years. Its ultimate mission is to maximize asset value, while prioritizing nuclear safety, provide a solid foundation for the sustainable development of the nuclear energy industry, and fulfill long-term responsibilities to the environment and society.

The global Nuclear Asset Management market size was estimated at USD 1450.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.00% during the forecast period.
