## Abstracts

The Nuclear Core Monitoring System is a system specifically designed to monitor the physical conditions of the nuclear reactor core. It usually consists of a series of detectors that are introduced into the channel near the nuclear reactor core, which can sense and measure the physical conditions in the core (such as temperature, pressure, radiation level, etc.) and convert these conditions into corresponding output signals. These signals are then used to analyze and evaluate the operating status of the nuclear reactor to ensure its safe, stable and efficient operation. The system is an important part of the safe operation of nuclear power plants and is of great significance for preventing nuclear accidents and ensuring the safety of personnel.

The global Nuclear Core Monitoring System market size was estimated at USD 225.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.90% during the forecast period.
