## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Nuclear Power Generator Rotors competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. A Nuclear Power Generator Rotor is the rotating component of the electric generator used in a nuclear power plant. It converts the mechanical energy produced by the turbine (driven by steam from the nuclear reactor) into electrical energy through electromagnetic induction. In 2024, global Nuclear Power Generator Rotors Industry production reached approximately 1304 units, with an average global market price of around US\$ 85 K per unit. The production capacity for Nuclear Power Generator Rotors Industry in 2024 was approximately 1350 units. The typical gross profit margin for Nuclear Power Generator Rotors Industry is between 20% and 40%. Nuclear power generator rotors are critical rotating components in nuclear power plants, responsible for converting mechanical energy from steam into electricity. The upstream includes suppliers of high-strength steel, special alloys, and precision forging and machining companies, while the downstream serves nuclear power plant manufacturers, unit installation companies, and O&M service providers. The market is constrained by nuclear plant construction scale, unit capacity, and strict safety standards, and has high technical barriers, with production capabilities concentrated among a few companies able to manufacture nuclear-grade large components.

The global Nuclear Power Generator Rotors market size was estimated at USD 111.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.10% during the forecast period.
