Abstracts

Nuclear power steam turbines are specialized large-scale mechanical devices that convert thermal energy from nuclear fission reactions into mechanical energy by using high-pressure steam generated in the reactor's steam generator to drive a turbine rotor, which is then coupled to an electrical generator to produce electricity; these turbines are engineered to handle saturated or slightly superheated steam conditions unique to nuclear power plants, differing from fossil-fuel turbines that typically use superheated steam, and are characterized by their immense size, low-pressure operational stages, and stringent safety and reliability requirements due to the critical nature of continuous, stable power output in nuclear facilities. The global market for nuclear power steam turbines is primarily driven by the expansion and modernization of nuclear energy capacity in regions emphasizing carbon-free baseload power, with demand concentrated in countries investing in new reactor construction, such as China, India, Russia, and several nations in the Middle East and Eastern Europe, while Western markets like the United States and parts of Europe focus more on turbine upgrades, life extensions, and efficiency improvements for existing nuclear fleets; key industry players include large multinational corporations like General Electric, Siemens Energy, Mitsubishi Heavy Industries, and Toshiba Energy Systems, which dominate due to their technological expertise, extensive service networks, and ability to deliver customized solutions for various reactor types, including pressurized water reactors (PWRs) and boiling water reactors (BWRs). Market growth is supported by increasing global electricity demand, decarbonization policies, and nuclear energy's role in grid stability, though it faces challenges such as high capital costs, long project lead times, competition from renewables, public opposition in some regions, and geopolitical factors affecting nuclear supply chains; emerging opportunities include the development of advanced small modular reactors (SMRs), which may require smaller, more modular turbine designs, and digitalization trends enabling predictive maintenance and

operational optimization through IoT and AI integration.

The global Nuclear Power Steam Turbine market size was estimated at USD 5820.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.75% during the forecast period.
