Abstracts

Nuclear simulation software is a computer program specifically designed to simulate the physical behavior of nuclear energy systems (such as nuclear reactors, nuclear fuel cycles, and radiation protection). Its core function is to replicate complex processes within nuclear reactors, such as neutron transport, thermal hydraulics, and material irradiation effects, through mathematical modeling and numerical calculations. It also simulates the propagation, attenuation, and biological effects of nuclear radiation in the environment. This type of software typically integrates multi-physics coupling algorithms and, combined with experimental data for verification, provides a scientific basis for nuclear energy design, safety analysis, accident response, and policy formulation.

The global Nuclear Simulation Software market size was estimated at USD 153.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.10% during the forecast period.
