Abstracts

Nucleic acid gel stains are fluorescent dyes used in molecular biology to visualize nucleic acids (DNA or RNA) after electrophoresis, enabling researchers to detect, quantify, and analyze genetic material based on size and concentration. These stains intercalate with or bind to nucleic acids and emit fluorescence under specific wavelengths of light. Key product categories include intercalating dyes like ethidium bromide (traditionally popular but declining due to toxicity), SYBR?-based dyes (safer alternatives with higher sensitivity), and newer options such as GelRed? and GelGreen? (non-mutagenic and environmentally friendly). Advancements focus on improving sensitivity, reducing toxicity, ensuring compatibility with downstream applications (e.g., PCR or cloning), and providing formats suited for various gel types (agarose or polyacrylamide) and detection systems (UV or blue light transilluminators).

The global Nucleic Acid Gel Stains market size was estimated at USD 52.3 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.85% during the forecast period.
