Abstracts

Nylon 6 and Nylon 66 Tube are pipes made from two types of engineering plastics, nylon 6 and nylon 66. Nylon 6 is produced by the ring - opening polymerization of lactam, while nylon 66 is obtained by the polycondensation of adipic acid and hexamethylenediamine. These two types of pipes have many excellent properties. They have high mechanical strength, capable of withstanding large pressures and external impacts; good chemical stability, being resistant to many chemicals and not easily corroded; excellent wear resistance, able to be used for a long time in high - friction environments with little wear; good self - lubrication, which can reduce the resistance during fluid transportation; and also have a certain degree of flexibility, facilitating installation and laying. Therefore, they are widely used in industries such as machinery, automobiles, chemicals, and food, and can be used to transport various liquids, gases, and granular materials.

The global Nylon 6 and Nylon 66 Tube market size was estimated at USD 892.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.70% during the forecast period.
