Abstracts

O cresol novolac epoxy resin is a high-performance thermosetting polymer synthesized from the reaction of epichlorohydrin with a cresol novolac oligomer, characterized by its multifunctional epoxy groups that enable the formation of highly cross-linked, dense networks upon curing, resulting in superior thermal stability, chemical resistance, and mechanical strength compared to standard bisphenol-A based epoxy resins. This material is primarily utilized in demanding applications such as semiconductor encapsulation, printed circuit board laminates, high-temperature adhesives, and composite matrices, where its ability to maintain structural integrity and electrical insulation properties under extreme conditions?including elevated temperatures and exposure to aggressive chemicals?makes it indispensable. The resin?s performance attributes stem from its high epoxy functionality and aromatic structure, which contribute to a high glass transition temperature and low coefficient of thermal expansion, aligning with the stringent requirements of advanced electronics, aerospace, and automotive industries.

The global O Cresol Novolac Epoxy Resin market size was estimated at USD 125.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.80% during the forecast period.
