Abstracts

An object side telecentric lens is a specialized optical component designed to maintain a constant magnification regardless of the object?s distance from the lens within its depth of field, achieved by positioning the aperture stop at the front focal plane so that the chief rays are parallel to the optical axis on the object side. This design eliminates perspective error and minimizes measurement inaccuracies caused by variations in working distance, making it critical for high-precision machine vision, metrology, and inspection applications where dimensional accuracy is paramount, such as in semiconductor manufacturing, electronics assembly, and automated quality control systems. These lenses are characterized by their ability to provide distortion-free imaging, consistent sizing of features, and improved edge detection performance, particularly when inspecting three-dimensional objects or components positioned at varying heights, thereby ensuring reliable data acquisition for critical decision-making in industrial automation and scientific research.

The global Object Side Telecentric Lens market size was estimated at USD 125.4 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.80% during the forecast period.
