Abstracts

Ocean Bottom Node (OBN) seismic acquisition is a geophysical survey method where autonomous, battery-powered recording devices called nodes are placed directly on the seafloor to capture seismic waves generated by controlled sources (air guns, vibrators). Unlike traditional towed-streamer systems, OBNs remain stationary during recording, which enables them to collect high-quality, full-azimuth, long-offset data with minimal noise interference from surface conditions. This approach is particularly valuable for imaging beneath complex geology such as salt bodies, improving subsurface resolution for oil and gas exploration, carbon storage monitoring, and other offshore geoscience applications. It is more flexible and scalable than earlier ocean bottom cable (OBC) systems, though generally costlier and logistically more demanding.

The global OBN Seismic Acquisition market size was estimated at USD 152.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.10% during the forecast period.

This report offers a comprehensive and in-depth analysis of the global OBN Seismic Acquisition market, covering all critical facets from a broad macroeconomic overview to detailed micro-level insights.
