## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on OBN Seismic Receivers competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Ocean Bottom Node (OBN) seismic receivers are autonomous, battery-powered recording devices deployed on the seafloor to capture seismic signals for offshore oil, gas, and geological exploration. Unlike traditional towed streamers, OBNs are placed directly on the seabed—either individually dropped or deployed in grids—where they detect reflected and refracted seismic waves with very high fidelity and multi-component (3C or 4C) sensors. This configuration reduces noise from surface conditions, provides better subsurface imaging in complex areas (e.g., under platforms, in shallow waters, or near obstructions), and enables longer recording times. As a result, OBN seismic is increasingly favored for high-resolution reservoir characterization, 4D monitoring, and exploration in challenging marine environments. A realistic working number for new OBN (ocean-bottom node) seismic receivers is an average price of about \$10k per node and an annual global unit sell-through on the order of ~15k.

The global OBN Seismic Receivers market size was estimated at USD 152.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.10% during the forecast period.
