Report Overview

An oceanographic monitoring system can be defined as a system that is used to monitor activities in the ocean such as earthquakes, hurricanes, tsunamis, and floods among others. The oceanographic monitoring system provides real time data related to the height of waves, the magnitude of underwater earthquakes, and the speed of hurricanes among others to prevent and mitigate the damage caused by these disasters. The oceanographic monitoring system is helpful in detecting tsunamis, which are large waves of extremely long length and generated by a violent, impulsive undersea disturbance or activity near the coast or in the ocean. The oceanographic monitoring system constantly monitors the disturbances occurring on the surface of the ocean and send reports in case of a discrepancy in regular activities.
