Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on OCTG Steel Pipe competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. OCTG steel pipe refers to a type of seamless or welded steel pipe required for oil and gas resource exploration, drilling, and production. These pipelines are manufactured to meet the harsh conditions and pressures of underground environments, and are designed to operate safely, reliably, and efficiently. The main components of OCTG include casing, tubing, and drill pipe. OCTG steel pipes are used for transporting crude oil, natural gas, and other fluids in the oil and gas industry. It is composed of metal accessories and steel pipes of different sizes and grades, with each length of steel pipe having a special function and purpose. The purpose of connecting OCTG is to connect these steel pipes in series, establishing a network to transport oil and gas from one location to another. Drill pipe is a type of steel pipe used in oil and gas wells. It consists of several different parts, including a caliper tube, drill bit, drill rod, and casing. The Kai tube is connected to the drilling rig to assist in the rotation of the drill rod and is a part of the drill rod. A drill bit is the part of a drill rod that penetrates rock, usually made of steel or tungsten. The drill string is composed of drill rods that extend from the Kjeldahl tube to the drill bit, helping to provide support for the drill bit during drilling. The casing is the end of the drill pipe, which helps prevent the collapse of the oil well. All these components work together to assist in the normal operation of oil and gas wells. Casing and tubing are essential in the process of oil drilling. Before drilling begins, the casing is placed and wrapped around the wellbore. Its purpose is to protect soil layers and groundwater from contamination by drilling mud and/or fracturing fluid. In addition, casing can also stabilize the wellbore. Drilling and casing operations alternate - the drill pipe is removed at predetermined intervals, and then the wellbore is lined and

consolidated with casing. Oil pipes are used to transport oil from deep within oil wells to the surface. This is the third stage of wellbore technology. Oil and natural gas occasionally rise to the surface on their own; But usually a pump is needed to transport the liquid to the ground. The diameter of tubing is usually smaller than casing, except for casing with a diameter of 4.5 inches. Therefore, the oil pipe must be fixed on external support structures such as drilling rigs or platforms to prevent collapse due to pressure differences. In 2024, global OCTG Steel Pipe production reached approximately 16,999 K MT, with an average global market price of around US\$ 933 per MT. The annual production capacity of a single production line is 150,000 tons, with a gross profit margin of about 20%. Upstream raw materials: Round tube blank: core raw material, that is, round steel of a specific steel grade. Alloying elements: nickel, chromium, molybdenum, etc., used to produce corrosion-resistant and high-strength steel grades. Downstream application areas: Oil and gas exploration and development companies, oilfield technical service companies. Raw material cost: 50%-70%; manufacturing overhead: 20%-35%; labor cost: 5%-10%. OCTG steel pipe connection types: API connection and advanced connection. API connection is a widely used connection method in the oil and gas industry. They comply with and exceed all regulatory standards of the American Petroleum Institute (API). The API defines two types of connectors: interference free connectors (NU) and external interference connectors (EU). NU connection is used to connect two pipes with the same diameter, while EU connection is used to connect two pipes with different diameters. Advanced connection is a special proprietary connection that has advanced features that API connections do not possess. Most advanced connections provide metal to metal sealing to enhance the integrity of high-pressure sealing. Advanced connections have the characteristics of direct connection, no slots, and special gaps. This connection is suitable for gas wells, high-pressure wells, and wells that are prone to producing corrosive wastewater.

The global OCTG Steel Pipe market size was estimated at USD 15860.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.80% during the forecast period.
