Abstracts

The odor scanner is a novel instrument developed in the 1990s for rapid detection of food. It quickly provides overall information about the sample under test with specific sensors and pattern recognition systems, indicating the hidden characteristics of the sample. The electronic tongue is a sensitive membrane that uses materials similar to biological systems as sensors. When one side of the lipid membrane is in contact with a taste substance, the membrane potential changes, resulting in a response to detect the relationship between various substances. . This taste sensor has high sensitivity, reliability and repeatability. It can quantify the sample, and at the same time, it can measure the content of some components by laboratory or public inspection, which becomes difficult to obtain and do not show. Scientific instruments are the basis for scientific research and technological innovation. In today"s era of competition for scientific and technological strength, the global demand for scientific instruments continues to grow. According to statistics, the global laboratory analysis and life science instrument market will exceed US\$69 billion in 2021. Driven by the rapid development of global science and technology, the global scientific instrument industry market size will continue to grow. It is expected that the global laboratory analysis and life science instrument market size will increase to US\$102 billion by 2026, with a compound growth rate of 6.9% from 2021 to 2026. . As China, the United States, Japan, European countries and other major countries increase their investment in scientific and technological research and development, the market size of the global scientific instrument industry is expected to continue to grow.
