Abstracts

An off delay time delay relay is an electromechanical or solid-state switching device designed to interrupt a circuit after a preset time period has elapsed following the de-energization of its coil or control signal. Unlike on-delay relays, which initiate a timing sequence upon activation, the off delay variant begins its countdown when power is removed, maintaining the connected load in an energized state for a specified duration before opening the circuit. This functionality is critical in applications requiring a controlled shutdown, such as cooling fan operation after machinery is turned off, motor braking sequences, or safety processes where residual operation must continue briefly after a main power cutoff. These relays are characterized by adjustable timing ranges, various contact configurations (e.g., normally open or normally closed), and mounting options to suit diverse industrial and automation environments.

The global Off Delay Time Delay Relay market size was estimated at USD 142.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.75% during the forecast period.
