Abstracts

Offshore aquaculture, also known as open-ocean aquaculture, refers to the farming of fish, shellfish, or aquatic plants in deep waters away from the coast, typically beyond significant coastal influence and often in waters more than 3 nautical miles from shore. Offshore systems are designed to withstand strong currents, waves, and storms, and they aim to reduce the environmental impact and spatial conflict associated with nearshore aquaculture. According to data from the Food and Agriculture Organization of the United Nations (FAO), the global aquatic product farming volume has shown an increasing trend from 1959 to 2021. According to preliminary statistics, the global aquatic product farming volume in 2021 was about 128 million tons. The State of World Fisheries and Aquaculture 2022 shows that total global aquaculture initial sales in 2020 was approximately US\$265 billion, with farm sales estimated to total US\$281.5 billion. Of the total aquaculture production, 87.5 million tons were produced of aquatic animals, mainly for human consumption; 35.1 million tons of algae, including food and non-food uses; 700 tons of shellfish and decorative pearls. Asian countries account for 70% of the global aquatic animal production in fisheries and aquaculture, followed by the Americas, Europe, Africa and Oceania.

The global Offshore Aquaculture market size was estimated at USD 3049.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.70% during the forecast period.
