Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Offshore Lifting Slings competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global Offshore Lifting Slings production reached approximately 6,800 k units with an average global market price of around US\$ 120 per unit, a single-line production capacity of approximately 25,000 units/year, and a gross profit margin of approximately 10%-30%. Offshore lifting slings are lifting devices specifically designed for offshore operating environments, featuring high corrosion resistance and wind-wave resistance. These slings are typically made of high-strength synthetic fibers or metal chains to ensure stability and reliability in harsh marine environments. Offshore lifting slings are widely used in offshore platforms, ships, diving operations, and offshore wind power, among other areas, for lifting heavy equipment and cargo. Their design takes into account the peculiarities of the marine environment, such as high humidity, salt spray corrosion, and strong winds and waves, ensuring the safety and durability of the slings during prolonged use. The upstream stage mainly involves the production of raw materials such as high-strength synthetic fibers (e.g., polyester, Dyneema, and Kevlar) and alloy steels used for wire ropes and fittings. The midstream stage focuses on the manufacturing and assembly of lifting slings, including processes such as weaving, braiding, coating, load testing, and certification to meet offshore safety standards like DNV-GL and EN 1492. The downstream segment includes applications in offshore oil and gas platforms, wind farms, shipyards, and heavy marine construction projects, where these slings are used for load handling, installation, and maintenance operations under harsh marine conditions. The offshore lifting slings market serves as a critical component of the global offshore oil, gas, wind, and marine construction industries. These slings, made from high-strength synthetic fibers, steel wire ropes, or alloy chains,

are essential for safe and efficient load handling under harsh offshore conditions, including saltwater exposure, high winds, and heavy lifting requirements. The market is driven by ongoing offshore oil and gas exploration, expansion of offshore wind farms, and increasing investment in marine infrastructure projects. Technological advancements, including high-modulus synthetic fibers, corrosion-resistant coatings, and intelligent load monitoring, are enhancing performance, durability, and ease of use.

The global Offshore Lifting Slings market size was estimated at USD 812.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.10% during the forecast period.
