Report Overview

An oil diffusion pump is a type of fluid-entrainment pump that produces high vacuum by operating with a fast-moving stream of pump fluid in vapor form. The pump is operated with an oil of low vapor pressure, which is heated by an electrical heater vessel to generate a high-speed jet. The oil vapor expands after passing through the jet stack nozzles, and transports gas molecules from the inlet to the exhaust. The oil is gaseous when entering the nozzles, and the flow changes from laminar to supersonic and molecular within the nozzles.

This report offers a comprehensive and in-depth analysis of the global Oil Diffusion Pumps market, covering all critical facets from a broad macroeconomic overview to detailed micro-level insights.
