Abstracts

An oil-fired marine boiler is a specialized combustion system designed for maritime applications that utilizes fuel oil as its primary energy source to generate steam for propulsion, auxiliary power, or heating functions aboard vessels. These boilers are engineered to operate efficiently in the demanding marine environment, characterized by variable loads, saltwater exposure, and stringent regulatory standards. Key components typically include a furnace, heat exchanger, fuel injection system, and exhaust gas treatment units, with designs ranging from traditional fire-tube boilers to more modern water-tube configurations depending on the vessel?s size and operational requirements. They are critical for powering steam turbines in older or specialized ships, providing hot water and steam for onboard services, and ensuring compliance with international emissions regulations through integrated pollution control technologies. The reliability, fuel flexibility, and adaptability of oil-fired marine boilers make them a fundamental element of maritime engineering, particularly in contexts where alternative fuels or electrification are not yet viable.

The global Oil Fired Marine Boiler market size was estimated at USD 287.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 3.45% during the forecast period.
