Report Overview

Centrifugal Chiller is a centrifugal compressor uses a rotating disk or impeller to force gas to the rim of the impeller, increasing the velocity of the gas; a diffuser converts the velocity energy to pressure energy, the chiller then uses the vapor compression cycle to chill water (or other fluids) and transfers the heat collected from the chilled water plus the heat from operating compressor to a second water loop that can be cooled by a Cooling Tower. Oil-free centrifugal chiller has simplified the piping structure by eliminating oil-related parts. There is no need to replace oil or filters, so users can save time and money at the same time.
