Abstracts

An oil-free pressure booster is a specialized type of air compressor or gas booster system that increases the pressure of a gas?typically air or inert gases?without introducing any oil or lubricants into the compressed medium. These systems are critical in applications where oil contamination is unacceptable, such as in food and beverage processing, pharmaceutical manufacturing, medical and laboratory environments, semiconductor fabrication, and other clean industries. Operating through mechanisms like diaphragm, piston, or scroll technology, oil-free boosters ensure that the output gas remains pure, meeting stringent regulatory and quality standards while offering advantages in maintenance, environmental compliance, and operational safety.

The global Oil Free Pressure Booster market size was estimated at USD 1582.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
