Abstracts

An oil-free reciprocating vacuum pump is a device that creates a vacuum environment by inhaling, compressing and discharging gas through the reciprocating motion of the piston in the cylinder. The design of this pump avoids the pollution problems that may be caused by the use of lubricating oil in traditional vacuum pumps, so it is widely used in many occasions with high cleanliness requirements. The working principle of an oil-free reciprocating vacuum pump is relatively simple. It mainly consists of a pump body, a piston, a cylinder, an intake valve and an exhaust valve. During operation, the piston reciprocates in the cylinder, thereby changing the volume in the pump body. When the piston moves downward, the intake valve opens and the gas enters the pump body; when the piston moves upward, the exhaust valve opens and the gas is discharged from the pump body. This reciprocating motion causes the gas in the pump body to be continuously discharged, thereby forming a vacuum inside the pump body.

The global Oil Free Reciprocating Vacuum Pump market size was estimated at USD 720.42 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 3.20% during the forecast period.
