Report Overview

During oil and gas production, crude oil is brought to surface by applying pressure through the tubing. After production, pressure is reduced, which separates the gas bubbles from the fluid and subsequently results in the formation of foam on the surface. This foam, if not treated, will cause problems during the transportation of oil and gas at atmospheric pressure. To stabilize the foam, certain additives are added or defoaming separators are used, i.e. chemical or physical defoaming is carried out.

The Middle East, followed by Asia Pacific, is a major market for the oil and gas defoaming separator market. Oil and gas refinery capacity is increasing in APAC, especially in China, India and ASEAN countries, owing to which the demand for defoaming separators is expected to increase over the forecast period. Further, the increasing production of oil and gas in North America and Europe will help drive the demand for oil and gas defoaming separators over the forecast period.
