Abstracts

Oil immersed capacitors are a type of passive electronic component where the dielectric material is submerged in oil to enhance insulation, heat dissipation, and voltage handling capabilities, making them particularly suited for high-power and high-voltage applications such as power transmission systems, industrial machinery, electric vehicles, and renewable energy infrastructure like wind and solar inverters. These capacitors rely on specialized oils?such as mineral, synthetic, or biodegradable varieties?to prevent dielectric breakdown, reduce partial discharges, and maintain operational stability under thermal and electrical stress, which is critical in environments demanding reliability, longevity, and efficiency over a wide temperature range. Their construction often involves metalized film or paper dielectrics housed in sealed containers to prevent leakage and contamination, ensuring consistent performance in demanding settings where dry or alternative capacitor technologies may fall short.

The global Oil Immersed Capacitors market size was estimated at USD 450.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
