Abstracts

Oil-immersed Shunt Reactors act as an absorber of reactive power in order to increase the energy efficiency of a power system. Shunt Reactors are used to compensate the capacitive reactive power that is generated by long and lightly loaded transmission lines, as well as underground cables. The global oil-immersed shunt reactor market refers to the market for shunt reactors that are immersed in oil for their operation. Shunt reactors are electrical devices used in power transmission and distribution systems to compensate for reactive power and regulate voltage levels. They are connected in parallel with power lines and provide inductive reactance to counterbalance capacitive reactance in the system. In oil-immersed shunt reactors, the reactor windings and core are immersed in a mineral oil or synthetic oil. The oil acts as both an electrical insulator and a cooling medium, ensuring efficient operation and heat dissipation. These reactors are typically used in high-voltage applications, such as substations and power transmission networks, to control voltage fluctuations and maintain system stability.

The global Oil-immersed Shunt Reactor market size was estimated at USD 2464.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.90% during the forecast period.
