Report Overview

The main functions of the transformer are: voltage transformation, current transformation, impedance transformation, isolation, voltage stabilization, etc. The voltage of AC transmission in China is up to 1,000 kV, while the voltage of generators is generally 3.15 kV, 6.3 kV, 10.5 kV and 15.75 kV, etc., which cannot be directly generated by generators, so it needs to be transmitted for a long distance through transformer boost. In addition, the working voltage required by most electrical appliances is generally 380V, 220V, 36V or smaller voltage, etc., also need to use the transformer to reduce the transmission voltage to meet the demand.

According to different classification methods, transformers are divided into the following categories: (1) according to the number of phase classification, divided into single-phase transformer, three-phase transformer and multi-phase transformer; (2) according to the use of classification, divided into power transformers, instrument transformers, furnace transformers, autotransformer and welding transformers; (3) according to the form of core structure classification, is divided into shell transformer, ring transformer and C type transformer; According to the cooling method, it is divided into oil-immersed transformer, air-cooled transformer, self-cooled transformer and dry-type transformer; According to the classification of core, it is divided into hollow transformer, magnetic core transformer and iron core transformer; According to the classification of moisture-proof, it is divided into open transformer, potting transformer and sealed transformer.
