Abstracts

Oil injected compressors are rotary screw air compressors where oil is continuously injected into the compression chamber to serve multiple critical functions, including sealing the rotors, lubricating moving parts, absorbing heat generated during compression, and reducing noise. This design allows for higher operating temperatures and pressures compared to oil-free alternatives, making these compressors highly efficient, durable, and suitable for continuous heavy-duty industrial applications such as manufacturing, construction, mining, and automotive sectors. The oil is subsequently separated from the compressed air through a multi-stage filtration system, though trace amounts may remain, which is acceptable for many industrial uses but not for sensitive applications like food processing or pharmaceuticals where oil-free air is mandated.

The global Oil Injected Compressors market size was estimated at USD 6500.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
