Report Overview:

Semi-rigid container foil is generally made of single-zero foil, and in order to make containers of various shapes, aluminum foil needs to be stamped and formed by stamping. However, without any treatment on the aluminum foil, in the stamping process, the aluminum foil will be scratched due to friction, which will reduce the quality of the product. Therefore, the surface of the aluminum foil is oiled before stamping, and the lubricating effect of the oil protects the surface of the aluminum foil from being affected and improves the quality of the product.
