Abstracts

Oilfield polyacrylamide refers to a class of high molecular weight synthetic polymers derived from acrylamide monomers, specifically engineered for use in petroleum extraction and enhanced oil recovery (EOR) operations. It functions primarily as a viscosifier and friction reducer in hydraulic fracturing fluids and as a mobility control agent in polymer flooding applications, where it improves sweep efficiency by altering the rheological properties of injected water to displace residual oil from reservoirs. Its anionic, cationic, or non-ionic characteristics can be tailored to suit varying reservoir conditions, such as salinity, temperature, and rock permeability, making it a versatile chemical additive essential for maximizing hydrocarbon yield and operational efficiency in both conventional and unconventional oilfields.

The global Oilfield Polyacrylamide market size was estimated at USD 685.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.80% during the forecast period.
