Abstracts

The OLED (Organic Light Emitting Diode) is a brighter, higher contrast display that has faster response times, wider viewing angles and consumes less power than conventional VFD, LED or Liquid Crystal Displays. OLED displays are self-illuminating due to their organic material and require no backlight for maximum visibility in all environments. OLED Displays are made up of a layer of organic material placed between two conductors. These two conductors (an anode and a cathode) are then between a glass top plate (seal) and a glass bottom plate (substrate). When an electric current is applied to the two conductors, the organic material produces a bright, electroluminescent light. When energy passes from the negatively charged layer (cathode) to the other (anode) layer, it stimulates the organic material between the two, which in turn emits lights that is visible through the outermost layer of glass. Global OLED Display key players include SMD, LGD, Futaba, JOLED, CCO, etc. Global top five manufacturers hold a share over 90%. South Korea is the largest market, with a share over 90%, followed by Japan and China Taiwan, both have a share over 5%.

The global OLED Displays market size was estimated at USD 69560.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.00% during the forecast period.
