Report Overview

OLED (Organic Light Emitting Diode) injection materials refer to organic molecular materials used in the manufacturing of OLED displays. OLED displays are composed of multiple layers of thin films, with organic injection materials playing a crucial role in constructing the luminescent layer and charge transfer layer of OLEDs. Electron injection layer material: The electron injection layer is located on the side of the luminescent layer and is used to promote the injection and transmission of electrons to the luminescent layer. The commonly used material is lithium nickel oxide lithium diamond (LiF), which has good electron injection performance. Hole injection layer material: The hole injection layer is similar to the electron injection layer and is used to promote the injection and transmission of holes to the luminescent layer. Commonly used materials include poly (3,4-ethylenedioxythiophene) (PEDOT), etc.
