Report Overview

FMM is mainly made of materials with extremely low thermal deformation coefficient, which is the key to defining pixel precision. After the production, the FMM is accurately positioned on the metal frame by the Mask Tension Machine and sent to the evaporation section. Under ultra-high vacuum, the evaporation machine evaporates the organic material through the FMM onto the limited area of the LTPS substrate. After the evaporation is completed, the LTPS substrate is sent to the packaging section, where it is bonded to the protective plate with high-efficiency glass glue that blocks water vapor in a vacuum environment.
