Abstracts

An OLED (Organic Light-Emitting Diode) mobile phone display is a type of screen technology that utilizes organic compounds to emit light when an electric current is applied, eliminating the need for a separate backlight. This self-emissive characteristic allows for individual pixels to be turned on or off independently, resulting in superior contrast ratios, true blacks, vibrant colors, and enhanced energy efficiency when displaying darker content. OLED displays are thinner, more flexible, and offer faster response times compared to traditional LCD screens, making them a preferred choice for modern smartphones, where slim form factors, high image quality, and advanced features like always-on displays and in-screen fingerprint sensors are increasingly demanded by consumers.

The global Oled Mobilephone Display market size was estimated at USD 45980.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 12.45% during the forecast period.
