Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on OLED Touch Chips competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, the global production of OLED touch chips will reach 1.078 billion units, with an average selling price of US\$2.5 per unit. An OLED touch chip is an integrated circuit (IC) based on capacitive sensing principles. It's specifically designed to detect and process finger or stylus contact on OLED displays, converting physical contact into electronic signals to enable interactive control of the device. It comprises an embedded touchscreen controller IC and a touch display integrated driver IC (TDDI). TDDI integrates the touchscreen controller into a DDIC. Its display principle is the same as that of TFT-LCD display driver ICs and is currently primarily used in LCD-screen smartphones. Existing dual-chip solutions use a separate system architecture, separating the display driver IC from the touchscreen IC, potentially introducing display noise. TDDI, on the other hand, utilizes a unified system architecture, enabling more efficient communication between the touchscreen and display driver ICs, effectively reducing display noise and better meeting the design requirements of thinner, narrower-bezel mobile electronic devices.

The global OLED Touch Chips market size was estimated at USD 2712.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
