Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Olefin Modified Styrene Acrylonitrile competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Olefin Modified Styrene Acrylonitrile (OMSAN) is an engineering thermoplastic created by blending styrene-acrylonitrile (SAN) with olefinic elastomers to improve impact strength, toughness, chemical resistance, and low-temperature performance while retaining SAN's rigidity and gloss, making it a mid-range alternative between ABS and standard SAN. Its supply chain begins with upstream petrochemical feedstocks—styrene, acrylonitrile, and olefinic copolymers—supplied by major monomer producers; these materials are compounded in midstream operations using twin-screw extrusion to achieve controlled rubber-phase morphology, additives dispersion, and melt-flow index required for automotive, appliance, and consumer-goods molding grades. Downstream, OMSAN pellets are shipped to injection-molders and extrusion processors that produce housings, interior trim, cosmetic parts, and small industrial components for OEMs across automotive, electronics, household appliances, and general consumer products. In 2024, global Olefin Modified Styrene Acrylonitrile output reached roughly 260,000 tons against an installed production capacity of about 310,000 tons, with typical pricing ranging from USD 1,650–3,200 per ton depending on olefin content, melt-flow grade, and reinforcement level, while manufacturers maintained an average gross margin of around 29%.

The global Olefin Modified Styrene Acrylonitrile market size was estimated at USD 511.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.80% during the forecast period.
