Report Overview

The olefins are the family of polymers consisting mainly of polyethylene, polypropylene or combinations of the two. Along with Teflon (PTFE) they are called “non-stick” polymers. This is because their inactive molecular structure is described as a “low energy” state. This non-stick quality is what makes olefins such common and useful plastics. Impressive architectural membrane materials are starting to be developed using olefins for both the base fabric and coating. High tensile and tear strengths along with flame-resistance can be achieved in materials that have a life span equal to PVC-coated polyester with a fraction of the embodied energy. Another advantage is that olefins can be woven and coated into widths of up to 160?.
