Abstracts

Oleogels are a class of soft materials in which an oily phase is immobilized within a three-dimensional network or matrix, typically formed by self-assembly or cross-linking of certain gelators. This structure restricts the mobility of the oil, giving the material a semi-solid or gel-like consistency while still retaining the properties of the oil. Oleogels can be considered as a type of colloidal system where the continuous phase is an oil and the dispersed phase is the gel network.

The global Oleogels market size was estimated at USD 850.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.20% during the forecast period.
