Report Overview

Oligonucleotides are short DNA or RNA molecules, oligomers, that have a wide range of applications in genetic testing, research, and forensics. Commonly made in the laboratory by solid-phase chemical synthesis, these small bits of nucleic acids can be manufactured as single-stranded molecules with any user-specified sequence, and so are vital for artificial gene synthesis, polymerase chain reaction (PCR), DNA sequencing, library construction and as molecular probes. In nature, oligonucleotides are usually found as small RNA molecules that function in the regulation of gene expression (e.g. microRNA), or are degradation intermediates derived from the breakdown of larger nucleic acid molecules.

With the rising concept of oligonucleotide as diagnostic, research and therapeutic agent, it is noticed that companies investigating the potential of oligonucleotide is going up. Number of small companies or start-ups entering the market is continuously increasing due to its potential advantages. Over the past few years, there has been explosive growth in number of research article published in the area of oligonucleotide and its products. Various techniques are used in testing of oligonucleotide out of which Polyacrylamide gel electrophoresis (PAGE), Reverse Phase High Pressure Liquid Chromatography (RP HPLC), and Anion Exchange High Pressure Liquid Chromatography (AEX HPLC) are used majorly as these techniques provide highly accurate analytical screenings of oligonucleotide and provide optimum results. Technique such as IE-HPLC is used instead of RP-HPLC as IE-HPLC provides improved purification of nucleotides with substantial secondary structure, often found in sequences with higher GC content.
