Report Overview:

Many pharmaceutical companies were conducting research on oligonucleotide therapy, which employs chemically synthesized nucleotide-like small molecule drugs with potential specificity similar to that of therapeutic antibodies.

Although several types of oligonucleotide therapies exist, five of them are compared here, including the ones targeting nucleic acids (such as mRNA) or proteins, as well as others intended for stimulation of the immune system. DDS is generally used with oligonucleotide therapy, as it is difficult for these molecules to penetrate cell membrane when administered on their own.

The Global Oligonucleotide Therapy Market Size was estimated at USD 3847.20 million in 2023 and is projected to reach USD 4756.67 million by 2029, exhibiting a CAGR of 3.60% during the forecast period.
