Report Overview

Olivine is a magnesium iron silicate mineral commonly found in igneous rocks, with the chemical formula $(\text{Mg,Fe})_2\text{SiO}_4$. It is widely recognized for its high melting point, durability, and resistance to chemical weathering, making it valuable in industrial applications such as refractory materials for furnaces, foundry sands, and heat-resistant linings. In recent years, olivine has gained attention for its potential role in carbon sequestration due to its ability to absorb CO_2 through natural weathering processes, positioning it as a material of interest in climate mitigation strategies. The mineral is also used as a gemstone (peridot) in jewelry, though industrial applications dominate its market demand. Key producers include Norway, the U.S., and China, with growing interest from sectors focused on sustainable technologies. Pricing is influenced by purity, grain size, and application-specific requirements, with industrial-grade olivine generally commanding lower prices compared to gem-quality variants. The market is expected to expand as carbon capture technologies and green industrial processes drive demand.

The global Olivine market size was estimated at USD 148.01 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 1.00% during the forecast period.
