Abstracts

An On/Off Float Control Valve is a type of valve that operates based on the principle of a float. It is designed to automatically control the flow of liquid in a system by opening and closing the valve in response to changes in the liquid level. The valve typically consists of a float chamber, a float, and a main valve. As the liquid level rises or falls, the float moves up or down within the float chamber, causing the main valve to open or close, thereby regulating the flow of liquid into or out of the system.

The global On Off Float Control Valves market size was estimated at USD 528.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.70% during the forecast period.
