## Abstracts

A hammer is a general term for a tool used to strike an object, consisting of a metal striking portion (head) and a hand-holding portion (handle). A one-handed hammer is a type of hammer that is primarily used for metalworking work. It is sometimes also called a pound hammer or ball-point hammer. The striking portion of a one-handed hammer has a gently curved surface (flat head) that is nearly flat on one side and a spherical shape (round head) on the opposite side. The flat-headed side is used for hammering in nails and pins, while the round-headed side is used for bending metal. The round head is particularly suitable for striking heated materials or workpieces. When using one-handed hammers for pin hammering, use the flat head side and strike the pin so that the center of the striking surface is straight at the pin. The flat head has a gently curved surface, so if you strike straight at the center of the flat head, you will not leave a strike mark on the material. However, if the periphery of the flat head hits the pin instead of the center, the shaft may be off-axis, resulting in damage to the material and possible injury to the operator. The round-head side is used for metal bending, rivet tip crimping, engraving, and grinding out marks that have been missed.

The global One-Handed Hammer market size was estimated at USD 345.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.20% during the forecast period.
