Abstracts

The linear spot pure solid-state lidar innovatively uses a line spot infrared laser light source to replace the traditional point light source, and combines it with a high-performance single-photon avalanche receiving chip. By optimizing the optical design of the transceiver and the anti-ambient light algorithm, TF-NOVA can stably measure black, high-brightness and small targets under strong outdoor lighting. Unlike single-point lidar, it is similar to a straight line. Compared with traditional laser scanners, it has obvious advantages in size, weight, power consumption and cost performance. It is especially suitable for applications that require a certain detection field of view range.

The global One-Line Spot LiDAR market size was estimated at USD 230.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.00% during the forecast period.
