Abstracts

One-time Programmable Read-Only Memory (OTP-ROM) is a computer storage memory chip that allows data to be written into the device using a PROM programmer, but only once. Once written, the data is permanently stored and cannot be changed. It is often used to store fixed programs and data, such as program codes for products such as electronic games or electronic dictionaries. Because it can only be programmed once, if the programming is wrong, the chip can only be purchased again.

The global One Time Programmable Read Only Memory market size was estimated at USD 769.31 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.00% during the forecast period.
